EDUCATION

Novosibirsk State University, Computer Science *September 2023 — May 2028*

- Bachelors in Computer Science (department of Mechatronics and Robotics).

RELEVANT WORK EXPERIENCE

AI Data Annotator / AI Trainer *August 2025 — January 2026*
DataAnnotation.tech *United States*

- Annotated, created, reviewed and evaluated data to train and improve LLMs.
- Applied analytical skills and critical thinking to come up with challenging tasks/prompts, evaluate AI-generated responses, and revise model reasoning steps.
- Completed 1,200+ annotation tasks, ranging from basic review to writing executable code for AI agents.

PROJECT EXPERIENCE

Jarvis Voice Assistant *September 2026*
Edge Device Programming Course *Group Project*

- Co-built a fully local smart-home voice assistant (wake word, Whisper STT, speaker ID, Qwen2.5-1.5B LLM, Piper TTS) running on a Rockchip RK3588 edge board.
- Owned the per-user memory module: SQLite + sqlite-vec semantic search (RAG) over each user's facts, schedule and past conversations, with background iCloud calendar sync and Spotify playback voice controls. Led on-device deployment and co-developed an HTTPS web interface for talking to the assistant from a phone over a private VPN. Fine-tuned a pretrained Piper TTS model on 1,000+ recorded voice samples to give the assistant a custom voice.
- Delivered a working assistant that recognizes who is speaking and answers personal questions from that user's own data, live on the target hardware. **Final grade: A.**
- Source code available on GitHub: https://github.com/gvbelavin/Jarvis_from_Spartans/

ChatTutor Telegram Bot *Spring 2025*
Personal Project *Individual Project*

- Designed and developed a Telegram chatbot to support language learners through natural conversation practice. Built entirely in Python with asynchronous programming and PostgreSQL, the bot engages users in realistic dialogue while storing interaction data for continuous improvement.
- Implemented multilingual support using gettext for localization, and integrated OpenAI's API to generate dynamic, tutor-like responses. The bot features clean onboarding, intuitive UX, and a scalable backend architecture capable of handling concurrent user sessions.
- Produced a fully functional bot, plus a roadmap for tutor personalities, voice/media input and tiered monetization.
- Source code available on GitHub: https://github.com/LessVegetables/language-bot

PONG Emulator *January 2024 — June 2024*
Digital Systems & Architecture Course *Group Project*

- Designed and implemented a low-level emulator of the original PONG game using Logisim and a custom-built CdM8 8-bit CPU architecture. The project was developed under strict hardware-level constraints, including limited registers, no native multiplication/division, and memory-mapped I/O.
- Developed assembly-level code to handle paddle movement, ball physics, collision detection, and basic game logic. Created a "bot" opponent optimized to function within a limited instruction set and minimal clock cycles.
- Successfully completed a fully functional two-player PONG game running on the emulated CPU within the Logisim environment. **Final grade: A.**
- Source code available on GitHub: https://github.com/LessVegetables/ping-pong

GameOfLife *January 2024 — June 2024*

Functional & Declarative Programming Course *Individual Project*

- Developed a graphical simulation of Conway's Game of Life entirely in C using the Raylib graphics library. Focused on the UI, clean memory management, grid-based logic, and efficient rendering to support real-time updates of large cell arrays.
- Implemented custom data structures to track generations, user interaction controls (pause, reset, step, color), and an intuitive interface. Emphasized performance and responsiveness.
- Produced a polished, interactive simulation with a clean UI and responsive controls. **Final grade: A.**
- Source code available on GitHub: https://github.com/LessVegetables/game-of-life

LEADERSHIP EXPERIENCE

Class Representative *September 2022 — June 2023*

- Elected by peers to serve as the primary liaison between students and faculty, representing my group of 26 students. Facilitated communication of academic concerns, coordinated feedback sessions, and helped resolve issues related to coursework and scheduling.
- Organized group discussions, assisted in planning academic events, and ensured timely dissemination of important university updates. Strengthened collaboration between students and administration, improving overall student engagement and satisfaction.

SKILLS/CERTIFICATES

Languages: Fluent in English, Russian

Technical Skills:

- Programming Languages: C, C++, Python, Java, Swift, JS/HTML/CSS
- Frameworks/Libraries: Raylib, aiogram, OpenCV, FastAPI, Angular
- API Integration: OpenAI ChatGPT API, REST APIs
- Databases: PostgreSQL, SQLite
- Tools: Git, Docker, Visual Studio Code, Vim, Nginx, Claude Code
- Concepts: Gitflow, Asynchronous Programming, Object-Oriented Programming, REST API Design, RAG/vector embeddings, LLM deployment
- OS: Linux, macOS

Certificates:

- **Mobile Application Development Certificate**

  Novosibirsk State University — Continuing Professional Education

  250 hours, 2024–2025

INTERESTS

Detail-oriented data annotation specialist with hands-on experience evaluating LLM outputs and applying complex guidelines to ambiguous content. Strong analytical and written communication skills; comfortable working independently in remote environments.

Sports: Cross country skiing/running, rock climbing, biking, hiking.

Love the outdoors. Love interacting with people. Natural leader and a team player. Love working on meaningful projects.

Forever chasing the perfect self-hosted setup.
